

# IT1244

Artificial Intelligence: Technology & Impact

Week 4 Tutorial 2

# TODAY'S AGENDA

1. Recap of concepts
2. Pollev Questions
3. Discussion of tutorial questions

# RECAP

# THREE LEVELS OF ANALYTICS

## 1. Descriptive Analytics

- What happened?
- Clustering, PCA
- Data visualization

## 2. Predictive Analytics

- What will happen?
- Classification, regression
- Forecasting

## 3. Prescriptive Analytics

- What should we do?
- Search, planning, optimization
- Decision support

# SEARCH ALGORITHMS IN AI

## What is a search algorithm?

- a systematic process used by an AI agent to navigate through a "problem space" to find a solution or reach a goal state

## Input

- Problem Formulation: States, Actions, Transition model, Goal test, Path cost, etc

## Output

- Sequence of actions to reach the goal state from the current state

# SEARCH ALGORITHMS IN AI

Problems that use search algorithm:

Finding 'best'  
path for you

Amazon robotics to  
navigate warehouse

How to Make a Pathfinding  
Enemy NPC in Roblox Studio!

# SEARCHES

## Formulating a search problem

| Component          | Description                                                                   |
|--------------------|-------------------------------------------------------------------------------|
| State Space        | Set of all possible configurations a system can be in at any point of time.   |
| Action Space       | Set of all possible moves <b>given the current state</b> .                    |
| Successor Function | Given current state and a possible action, return the next state / successor. |
| Start State        | The state from which the search algorithm starts.                             |
| Goal Test          | The condition that determines whether the given state is a goal state.        |
| Path Cost          | A numerical cost associated with a given path.                                |

# SEARCHES

## Formulating a search problem: 8 Puzzle Game

### Input:

- State space:

|   |   |   |   |   |   |   |   |   |   |   |   |     |   |   |   |
|---|---|---|---|---|---|---|---|---|---|---|---|-----|---|---|---|
|   | 4 | 1 | 8 | 3 | 6 | 2 |   | 5 | 6 | 2 | 4 | ... | 1 | 2 | 3 |
| 2 | 6 | 7 | 4 | 2 |   | 1 | 7 | 3 | 7 |   | 8 |     | 4 | 5 | 6 |
| 8 | 5 | 3 | 5 | 1 | 7 | 5 | 6 | 4 | 1 | 3 | 5 |     | 7 | 8 |   |

- Action space: { tile-up, tile-down, tile-right, tile-left }

- Successor function:

- Start state:

|   |   |   |
|---|---|---|
| 6 | 2 | 4 |
| 7 |   | 8 |
| 1 | 3 | 5 |

- Goal test:

|   |   |   |
|---|---|---|
| 1 | 2 | 3 |
| 4 | 5 | 6 |
| 7 | 8 |   |

- Path cost : number of steps in path (step cost of 1)

# SEARCHES

## Search Tree

- Root node = start state
- Child nodes = successor states
- Edges = actions from one state to another  
and cost of that action

<https://tristanpenman.com/demos/n-puzzle/>

# SEARCHES

## State vs Node

- **State:** Specific configuration / Snapshot of the problem
- **Node:** Data structure that the state is stored in computer memory. Contains its parent, child, depth, path cost etc information about that state

|   |   |   |
|---|---|---|
| 6 | 2 | 4 |
| 7 |   | 8 |
| 1 | 3 | 5 |

**State**

**Node**

} Path Cost, Depth, Parent,  
Child/Children

# SEARCHES

Frontier: Store nodes that have been discovered but not yet expanded.

GIF

Add Node "A" to Queue

Frontier Queue  
FIFO (First in First Out)

Breadth-first-search (BFS) - FIFO / Queue

# SEARCHES

Frontier: Store nodes that have been discovered but not yet expanded.

GIF

Add Children of Node "A" to the Stack

Depth-first-search (DFS) - LIFO / Stack

# SEARCHES

Explored Set: set that stores already expanded states (so we don't revisit them)

# SEARCHES

## Types of search techniques:

# SEARCHES

## Types of search techniques

Different methods to determine the order of picking node for expansion

### Uninformed Search

- Blind search
- “I don’t know which node is closer to the goal bro”
- idk which station is closer → blindly explore all paths until I find one

### Informed Search

- Guided by heuristics
- “It's ok bro, heuristic gave me an estimate of how close I am to the goal”
- When you do have information that can help estimate which is expansion MAY be better → use informed search

# SEARCHES

## Evaluation of search algorithms

1. Completeness: **Guarantee of finding a solution** if there exists one for a given problem.
2. Optimality: **Guarantee of finding the best solution** (e.g. lowest path cost, shortest path, etc.)
3. Time Complexity: Time spent to find a solution.
4. Space Complexity: Memory space needed to perform the search.

Time and Space Complexity is not a big concern for this module! 🎉

# SEARCHES

## Breadth-First Search (BFS)

## Characteristics

- Going level by level
- Frontier: Queue (FIFO)
- Result: {8, 3, 10, 1, 6, 14, 4, 7, 13}

## Properties

- **Complete:** Yes (if branching factor is finite)
- **Optimal:** Yes (if all step costs are equal)
- **Time & Space Complexity:** Takes up more space compared DFS (stores all nodes at the current level)

Add Node "A" to Queue

# SEARCHES

## Depth-First Search (DFS).

## Characteristics

- Left until hits end → Backtrack
- Frontier: Stack (LIFO)
- Result: {8, 3, 1, 6, 4, 7, 10, 14, 13}

## Properties

- **Complete:** Yes (if state space is finite)
- **Optimal:** **No** (there might be better solution(s) at shallower level)
- **Time & Space Complexity:** More memory-efficient for deep graphs because it only stores the nodes along the single path it is currently exploring

Add Children to the Stack  
Check if Node "A" is the Goal

# SEARCHES

If you're confused on why it's optimal for BFS and not DFS

This is a better example to showcase why.

# SEARCHES

## Uniform Cost Search (UCS).

## Characteristics

- Return most optimal ('cheapest cost') path
- Requires positive path cost
- Frontier: **Priority Queue** (elements arranged in decending priority)

## Properties

- Complete: **Yes** (if branching factor is finite & all path costs are positive)
- Optimal: **Yes** (always; expands node at optimal path cost)
- Time & Space Complexity: **Worse than BFS**

# SEARCHES

## Uniform Cost Search (UCS).

1. Add S into Frontier

PQ = {(S, 0)}

2. Expand S

PQ = {(A, 1), (G, 12)}

3. Expand A

PQ = {(C, 2), (B, 4), (G, 12)}

4. Expand C (\*update frontier if better path is found)

PQ = {(D, 3), (B, 4), (G, 4)}

5. Expand D (\*don't update worse paths, SACDG has path cost 6)

PQ = {(B, 4), (G, 4)}

6. Expand B (\*don't revisit expanded nodes (node D))

PQ: {(G, 4)}

7. Expand G (\*Optimal path found: SACG, cost=4)

PQ: {}

# SEARCHES

## Uniform Cost Search (UCS) - FAQ

You mentioned that Uninformed is 'blindly' finding a path. But UCS chooses the one with the cheapest cost, that's not 'blindly searching'. Why is it being classified as Uninformed search?

Anyone know why? 🤔

# SEARCHES

## Uniform Cost Search (UCS) - FAQ

You mentioned that Uninformed is 'blindly' finding a path. But UCS chooses the one with the cheapest cost, that's not 'blindly searching'. Why is it being classified as Uninformed search?

If you go back to Slide 15, you'll notice that "I don't know which node is closer **to the goal** bro". UCS is uninformed because the 'cheapest cost' is simply cost from the starting node, not cost to the goal.

We still have no information on how close the node is to the goal, unlike informed search which we'll see next week. Hence, uninformed.

# TUTORIAL QUESTION 1

Explain the terms “Narrow AI” and “Artificial General Intelligence” with examples.

Anyone interested to share their findings? :D

# TUTORIAL QUESTION 1

## 3 stages of AI

### Narrow AI

Dedicated to assist with or take over specific tasks

### General AI

Takes knowledge from one domain, transfers to other domain

### Super AI

Machines that are an order of magnitude smarter than humans

Credit: Chris Noessel

# TUTORIAL QUESTION 1

## Narrow AI (Weak AI).

- AI designed for a **specific, limited task or range of tasks**, excelling within its specialized domain but unable to perform outside it
- Eg. Chess-playing AI, Facial Recognition

## Artificial General Intelligence (Strong AI, General AI).

- AI that possesses the ability to **understand, learn, and apply knowledge across a wide variety of tasks** at a level equal to or exceeding human intelligence.

Q: Is ChatGPT an AGI?

# TUTORIAL QUESTION 1

Q: Is ChatGPT an AGI?

As for now, not really.

- ChatGPT operates based on patterns and statistical probabilities in data, **rather than having genuine contextual understanding**
  - Hence it sometimes hallucinates
- ChatGPT **cannot act completely independently to pursue goals** over long periods (still needs prompting), which is a hallmark of AGI.

# TUTORIAL QUESTION 2

Give an example task for (i) Descriptive analytics,  
(ii) Predictive analytics and (iii) Prescriptive analytics.

Anyone interested to share? :D

# TUTORIAL QUESTION 2

## Descriptive analytics (What happened?).

- Using visualization and aggregations to attempt to understand or make value of historical data

## Examples

- Past Revenue and Sales Analysis
- Customer Behaviour Analysis
- Inventory Analysis

# TUTORIAL QUESTION 2

## Predictive analytics (What will happen?)

- Makes use of statistical algorithm, machine learning and other techniques to predict future events and outcomes

## Examples

- Forecasting Future Sales to optimize inventory levels
- Identify at-risk patient to begin early treatment if at risk

# TUTORIAL QUESTION 2

## Prescriptive analytics (What should we do?).

- Makes use of descriptive and predictive analytics' results to recommend a course of action that helps achieve desired results

## Examples

- Tiktok using past data of what you watched (descriptive) + predicts what you might watch based on similar genre (predictive)  
→ recommends videos on your FYP (prescriptive)

# TUTORIAL QUESTION 3

Given a Tree data structure.

Root to node 4:

a. Show the nodes visited as  
output of **BFS**

b. Show the nodes visited as  
output of **DFS**

# TUTORIAL QUESTION 3

BFS (Layer-by-layer).

$2a \rightarrow 7 \rightarrow 5a \rightarrow 2b \rightarrow 10 \rightarrow 6 \rightarrow 9$   
 $\rightarrow 5b \rightarrow 11 \rightarrow 4$

DFS (Left until cannot left anymore).

$2a \rightarrow 7 \rightarrow 2b \rightarrow 10 \rightarrow 6 \rightarrow 5b \rightarrow 11 \rightarrow$   
 $5a \rightarrow 9 \rightarrow 4$

# TUTORIAL QUESTION 4

Formulate a search problem for 4-Queen problem

The 4 Queens Problem: placing four queens on a 4 x 4 chessboard so that no two queens attack each other.

No two queens are allowed to be placed on the same row, the same column or the same diagonal.

# TUTORIAL QUESTION 4

Fun Question before we start:

How many solutions does 4-queens have?

# TUTORIAL QUESTION 4

How many solutions does 4-queens have?

Only 2 distinct answers!

# TUTORIAL QUESTION 4

Formulate a search problem for 4-Queen problem

| Component          | Description                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| State Space        | {All configurations on 4x4 chessboard}<br><i>Having 0, 1, 2, 3, or 4 queens in the board can also be considered as partial state in this example.</i> |
| Action Space       | {All the actions that we can take <b>given a current state of board</b> }                                                                             |
| Successor Function | Function that takes current state + an action (placing a queen somewhere) and outputs the new board configuration.                                    |
| Start State        | Empty board                                                                                                                                           |
| Goal State         | All queens are placed with no any pair of queens attacking each other                                                                                 |
| Path Cost          | 0, Not Applicable (Week 3 Lecture Slide 17)                                                                                                           |

# TUTORIAL QUESTION 4

## 4-queens Search tree

Note: The above implementation follows the convention in Assignment 2, i.e., column by column

# TUTORIAL QUESTION 4

## 4-queens Search tree

Is this search tree a BFS or DFS?

# TUTORIAL QUESTION 4

Let's visualize the process together!

<https://n-queen-five.vercel.app/visualize>

# TUTORIAL QUESTION 5

Given  $N$ -regions and  $M$ -colors, we want to fill in following map with colors such that no two adjacent regions have same colors. Formulate this as a search problem and draw the search tree.

# TUTORIAL QUESTION 5

| Component          | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| State Space        | {All combinations of colour assignments to each region}                            |
| Action Space       | {Assigning a colour to a region on the map <b>given the current state of map</b> } |
| Successor Function | Return map with painted (selected) region of the choice of colour                  |
| Start State        | Empty map with no colour on any region                                             |
| Goal State         | All regions are coloured in a way that none of the neighbours have the same colour |
| Path Cost          | 0 (Not applicable)                                                                 |

# TUTORIAL QUESTION 5

Search tree(Eg.  $M=3$ )

- Here we made assumption where each region has numbering, and we will colour the region in the ascending numbering sequence.
- We also set constraint to the number of possible colours that we are using.
- In reality, this will be a hard problem with large search tree in terms of branching factor and depth.

# QUESTION OF THE WEEK

Does BFS always uses more memory than DFS? If not,  
provide an counterexample.

# QUESTION OF THE WEEK

Does BFS always uses more memory than DFS? If not, provide an counterexample.

No.

BFS uses  $O(\text{maxWidth})$  memory, whereas DFS only uses  $O(\text{maxDepth})$ . So, when  $\text{maxWidth} < \text{maxDepth}$ , BFS uses less memory than DFS, though it is rarely the case.

# NEXT WEEK
